VENMAR®

Operation Guide

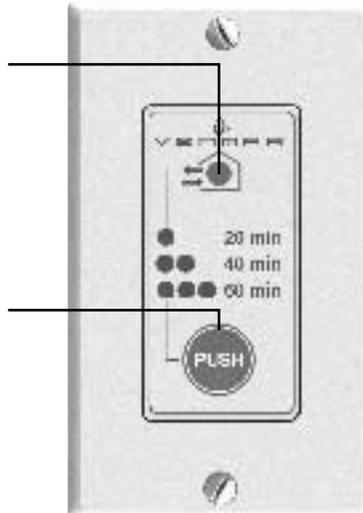

Venmar 20/40/60 Lighted Push Button

The **VENMAR 20/40/60 Lighted Push Button** is a low voltage, remote mounted control which provides 20, 40 or 60 minutes of high speed operation. After that time, the double arrow light at the top of the push button will go out and the VENMAR unit will return to the setting previously selected by the homeowner. This control can be used with all VENMAR Solo, Duo and HE models. Three color-coded, 22 gauge (or larger) wires make the connection from the lighted push button to the terminal block located inside the electrical box on the outside of the VENMAR unit. Each terminal is labeled I, OC, OL. It is critical that the same color wire is attached to the same position at each end. For example: red to I, blue to OC, black to OL. The lighted push button requires a standard single gang electrical box, and by code must be independent of any line voltage controls.

Located on the face of the VENMAR 20/40/60 Lighted Push Button is a "PUSH" button at the bottom, a "house with two arrows" on top of the control and the VENMAR logo above that. Following is a brief description of the operational features of this wall control:

Light indicating when HIGH SPEED has been activated. Will flash once for 20 min., twice for 40 min. and three times for 60 min.

- Press 1 time for 20 minutes of **HIGH SPEED** operation
- Press 2 times for 40 minutes of **HIGH SPEED** operation
- Press 3 times for 60 minutes of **HIGH SPEED** operation

The "PUSH" button at the bottom of the wall control, activates the VENMAR's HIGH SPEED operation mode for 20, 40 or 60 minutes when pressed once, twice or three times. The "house with two arrows" at the top of the control will flash accordingly. After 20, 40 or 60 minutes, the double arrow light will go off and the VENMAR unit will go back into the previously selected setting on the master control. If there is more than one Lighted Push Button in the home, each one will light up during activation and will go off after the 20, 40 or 60 minute time has expired. At any time during the HIGH SPEED operation the "PUSH" button may be pressed again to deactivate the HIGH SPEED feature and the VENMAR unit will return to its master control preset setting

Please contact your installing contractor for any further questions regarding the operational features of your VENMAR Lighted 20/40/60 Minute Push Button(s) or VENMAR Heat/Energy Recovery Ventilator.

Thank you for choosing VENMAR for your ventilation needs.
